

I've read the rule against auxiliary operation on VHF and frankly find it somewhat vague in how it relates to auxiliary operation. It seems to me that the overall concern is geared towards frequency overcrowding within a limited spectrum of bandwidth.

I don't believe that the use of Sky Command would cause any further use of existing spectrum, we are not utilizing any frequency that is allocated for repeater use. This is a simplex operation and most of the spectrum for simplex is being under utilized in my opinion.

I like many others in the amateur community have invested thousands of dollars in equipment for the use of Sky Command in hopes of having a more relaxed approach to the current interpretation of the rule against auxiliary operation. I urge you to review once again your previous decision and relax the rules so that Sky Command can become part of the amateur community and utilized as another means for us to communicate. Bear in mind that NOT every amateur will use Sky Command.

Thank you,
